Telecom

Deternet Telecom

Deternet Telecom is the bookstack instance that is dedicated to transforming the telecommunication industry into a commons. It tries to do this by explaining step by step the materials that are used, the tools that are needed and make the abstract network seem like tick tack toe. It will provide Hubs the ability to independently roll out their cables (fiber and copper) such that all telecom infrastructure eventually is in the hands of the community (the members of the hub) and is also maintained by it.
